ISBN: 9798396084162

## DEDICATION

To my grandmother Vernine Day who loved to read.

## CONTENTS

Chapter 1: Fallacy of the Big Bang Theory

Chapter 2: There is No Beginning or End

Chapter 3: Time is Only A Human  
Measurement

Chapter 4. There could be 'Aliens' but so  
what?

Chapter 5. The Human Race is Not Important

Chapter 6. Innovation is just an illusion

Chapter 7. Does What We Do Matter? No.

Chapter 8. What is The Meaning of Life?

Chapter 9. The Religious Paradox &  
Unexplained

Chapter 10. Life Has No Real Meaning. So  
Now What?

## PREFACE

This book may offend even though what's written is not intended to offend - it's just a theory, but everybody believes strongly in life, whether it be their purpose, doing good, being good, religious beliefs, belief in god or a higher calling. The writer is in no way trying to make you atheist or question the belief of your choosing. It's just another perspective for those curious about the nature of the universe and if life has any real meaning.

## 1 Fallacy if the Big Bang Theory

Before the Big Bang theory there was the steady state theory and before modern science the universe was a bit of a mystery called the heavens. Some people believed hell was literally in the ground below us and if you've even see lava coming out of a volcano the sheer ferocity and power of hot molten lava erupting and streaming out of a volcano where everything seems hot and inhospitable may seem like hell. The truth about nature is it is unforgiving. Most places in the universe are inhospitable and do not support life. Humans have always believed of some great self-importance even though our own existence has been relatively short compared to the existence of stars and planets. Some of the space junk or debris from humans in space or other planets like mars may be around longer the humans since space is like a vacuum and time is on its side. Civilizations however rise and fall if history is any indication. As humans from the Age of Enlightenment to the modern age built telescopes learning how infinite and fast the universe is with its millions of stars and that the Earth was not the center of the galaxy for which everything revolved around there started to become a separation between science and traditional religious views where God created the Universe with humans being the centerpiece like a chandelier in a nice house. People like Albert Einstein initially

embraced the Steady State theory that states that stars die and become new again and is kept at a constant state. Then the Big Bang came along proposing that the universe was empty space and started with a bang billions of years ago. The white noise on an old analog TV set between channels is remnants of the Big Bang. The Big Bang theory pleased creationist and traditional religious institutions that believed God created the universe told in Genesis. Human existence also seemed rare in the universe since the planet earth is in the 'Goldilocks Zone.' There was a lack of evidence of other intellectual life. This made it seem like humans were the only life out there like it was an act of God and everything we did was new and human progress was like fate, part of God's plan where everything we did had importance but is the Big Bang theory correct? The universe started with a bang and out of all these trillions of galaxy's came such a rarity like earth that can support advanced life and it also supports the existence of God and Genesis. Let's assume the Big Bang theory is correct and also earth is one of a kind. Other exoplanets just don't match the features Earth has to support and abundance of life including that of mankind. If you look at nature and even our own society rare things do happen. For example the odds of winning the jackpot lottery is (1 in) 44,416,353. The odds may seem impossible like you're

throwing your money away if you buy a ticket yet it does happen. Are all jackpot lottery winners piking all number right an act of God? Of course not. People win the jackpot all the time even though its million to one odds and the payout resets and becomes lower again. Just like sometimes a meteor will crash through someones roof or even strike them even though something like that would be extremely rare. It just goes to show there could be a Goldilocks zone and a planet like earth that spins on its axis to support life even though it may be extremely rare. The problem with the Big Bang theory is it defies common sense. Something does not come out of nothing as dictated by Einstein's mass-energy equivalence formula. Things materializing out of thin air or in outer space is not observed in nature. Scientist who promote the Big Bang will claim stars and planets came from an accumulation of gas i.e. hydrogen and helium started the big bang which was a very large explosion but then if space was void of anything for the longest time then where did the gas come from? Did the gas happen at one part of the universe or dead center. Does the universe consisting of empty space have boundaries? the Big Bang theory only seems to work when a person ask less questions. Then astronomers or scientist will say the Big Bang is from observation seeing the earliest galaxies and that galaxies are moving away from each other at an

increasingly fast pace. So if galaxies all started in the same place or a peculiar part of the universe and started moving away from each other and I got ahead of them with a spaceship would I just be heading toward empty space since space is infinite and there would be nothing ahead of me? Maybe if I got ahead of the galaxies expanding from the Big Bang I would eventually encounter more star systems from another Big Bang. See what I'm getting at? That brings me to the question if the Big Bang is false then what are scientists really seeing looking at older galaxies or the 'earliest galaxies?'

Here is a quote from the book *Gene Watson - Bevatron (2023)*:

"The Big Crunch is the stars in orbit around the galaxy spiral inward. The Big Bang is looking down the barrel of the plasma blowouts. Both happen at the same time. It takes billions of years. When the black hole exceeds a certain size it becomes a white hole that disperses very rapidly. The blowout is pure hydrogen that renews the Universe forming new stars and galaxies. Hence the overall picture remains the same steady state."

"In the 8th grade science class on Kings Avenue and Crockett they taught the steady

state theory in sharp contrast to the Big Bang theory. But the large telescopes that now exist did not exist then. What was taught is the Universe is large but finite. That was confirmed later on by larger telescopes that time lapsed photo to the edge of the Universe and calculated trillions of galaxies exist. They taught the overall picture remains the same and the amount of matter and energy is large but constant. The Big Bang theory is full of errors. If the universe contains trillions of galaxies the probability is high everyone that dies gets re created as newborn infants with no memory of existence prior. Moreover interstellar fleets exist at the upper limit of what mankind can accomplish. “

Meaning our perspective on the universe is skewed. It may be true that the earliest galaxies are older but probably not the first galaxies after the Big Bang. It is more likely instead that what becomes old becomes new again. This is evident in dying stars and new stars, black holes and supernova

## 2. There is No Beginning or End

It is speculated that the universe began 13.8 Billion years ago before the Big Bang but what was before the universe? That is called initial singularity containing all energy and

spacetime. The clock started ticking after the Big Bang and this period shortly after the Big Bang is called the Planck epoch. That is something hard to wrap your head around. How could there be nothing but energy and spacetime before the Big Bang? Another theory is we live in a cyclical universe where one universe dies out with all its galaxies and another one starts again in a cycle called the Big Crunch where there is another Big Bang starting all over again. This is getting closer to the steady state theory that was made obsolete by the Big Bang. Instead of something coming out of nothing the energy and elements are always there creating more big bangs that is a never ending cycle. The Big Crunch is also similar to the Steady State theory in that galaxies become old and new again through black holes and supernova. Siger of Brabant who authored the 13th Century thesis *The Eternity of The Word* was right in that the universe is without any beginning or end, therefore it is eternal. Infinity is actually supported by math so it is provable but it is hard for most people to fathom. An analogy would be going to a shopping mall and getting lost where there is store after store and it keeps going with no end in sight. You could exit the shopping mall but you would be in a parking garage far away from where you entered and parked your car. Humans are finite living on a globe or territory and having a limited lifespan. We

are accustomed to a beginning and an end. On earth if you went in one direction you'd circle the globe and be back to where you started but in space you'd keep going if you went in any direction eventually exiting our solar system and approaching another star system, galaxy, or just darkness and empty space.

### 3. Time is Only A Human Measurement

In the Universe there is no such thing as time since old stars die and new stars form. After awhile it's hard to measure what has happened before because there's no starting point or way to tell how far back time went. For this reason there will eventually be no record of our own existence or the accomplishments of humans. Time is a measurement we give in order to have structure to our daily lives and a perspective on the past but the universe is infinite so events in the past or even from previous civilizations are like they never existed with no record because stars and planets in the universe continually die and form new again. If there were more advanced beings or aliens from the distant distant past if you go back far enough we would never know about it. Telescopes like the Hubble Telescope can detect very old galaxies from far away but

there always has been galaxies that are new and then become old and die. Whether you believe in the Big Crunch where the universe expands and contracts with Big Bang after Big Bang or The Steady State where stars and galaxies come and go in an endless cycle it is impossible to measure how far back something had happened because if you go back far enough what was there is long gone. This is why infinity is very hard for people to comprehend and time can only be measured to a certain degree until it becomes immeasurable. This does not mean that time travel like going back in time is possible as evident in the world around you. If you drop something and it breaks for example, you can't go back where you did not drop it or you can go back to a previous time when you were younger. Everything happens in real time with cause and effect.

"It happened from another time for which I can't tell you when, let's just say it was in the past." Like in the movie Star Wars 'a long time ago in a galaxy far, far away.' Human time and even earth time is measurable because there are relics and carbon dating that can still be observed. Here's a fun thought: Could another version of you, that looked like you, that lived in a similar country with similar technology have existed in the distant past or could exist in the distant future? The answer is yes. Even though it is

extremely unlikely and sounds very science fiction that another version of you could have existed that's the beauty of infinity because there is an infinite universe of possibilities even if it may seem very improbable. I wasn't likely the first person to come up with this theory either - someone from the very distant past before there was an Earth on a planet very much like ours could have speculated the same thing about the nature of time. In fact, I can confidently say that no idea is new and has been thought up before, if not on this planet since people can come up with similar ideas or in another time and place that existed before us. People are also not individually unique since there is an infinite universe of possibilities there was probably another you that existed before in some other time and place.

#### 4. There Could Be 'Aliens' But So What?

In the past aliens were either science fiction or the unexplained with believers becoming the object of ridicule or UFO personalities selling books to a gullible audience but now the possibility of alien visitation with unexplained UAP revelations is today's reality. It's probably a given due to the vastness of the universe that we are not the only advanced life forms out there. Would

they becoming here though? Some have doubts due to the distance between stars. Even if they were or have always been here, perhaps migrating away from their home planet millions of years ago and just living in outer space - would it be such a big deal? Let's look at the concept of different levels of advancement: Since the Universe is infinite with no beginning or end with old stars dying and new stars forming it is certain that there is other life out there with different levels of technology advancement. All living creatures including humans eventually become extinct. In truth there is nothing in the universe that is truly 'alien.' Helium and hydrogen is not 'more alien' in another star system than our solar system. There is no guarantee that even if advanced life that originated somewhere else knew about the inhabitants of Earth i.e. humans that that they would want to establish diplomatic relations or 'first contact.' An example would be our own modern society and how there is a disassociation from indigenous people who are known to exist and live in the Amazon rainforest. It is fine for a nature show but very few people in a modern society have the desire to join an indigenous tribe and walk around naked in the forest hunting for monkeys and dodging venomous snakes or even partake in cannibalism. Our attitude toward so called 'aliens' is very science fiction and plays into our tribalistic warring

ways where 'UAP' or 'aliens' are very much viewed as an invading force depicted in science fiction movies. Yet this fear of hostile aliens lacks common sense. The odds of another species from another planet traveling to our solar system with the exact same atmosphere and bacteria that we have adapted to is next to impossible. This is coupled with the fact that even near speed of light travel is impossible, much less speed of light travel. Such interstellar travel capabilities means 'advanced aliens' could easily do away with humans without making themselves known or even declaring war. Our own military is obsessed with building more and more sinister weapons but the end game in such primitive behavior does not bode well for a species longevity. Aliens would probably not be warriors looking for a good challenge but instead view humans as primates in a lower level of evolution, as Gene Watson put's it:

From the book *Gene Watson - Irregular Desire* (2023):

"Alright, the problem with aliens eavesdropping on earth communications. It re-enforces the argument this planet is dominated by lying con artists in the business, political, and religious sector. Hence a planet to stay away from. One example is my pay TV. The transmitter

organization withdrew the classic films on channels 122, 149, 247, and its now all porn and commercials and who are they? Why they sit in the Italian parliament. What about religious leaders? They are wicked son of a bitches who use God as a puppet show fantasy to rake in investment capital to play the stock market. Then businesses sell consumers perishables like the unhealthy type that causes health problems. Then every time Silvana has to go to the hospital she comes back with a new illness she didn't have prior. And every time she has to take a large amount of medicine for problems they created she didn't have. What the aliens have is a fuck you response to earth civilization."

UFOs that people have seen and the ones captured on film by the military may be alien in nature but are only here for exploration or research purposes like how primitive mankind is affecting the Earth's ecosystem. Humans may be viewed as a gorilla at the zoo who likes throwing objects at spectators, flaunting its testicles with our militaries, polluting because of material consumption, and pounding its chest with our religions, nationalistic ideals like my tribe is better than your tribe. It's hard for humans to fathom that we are not that important to other life that may already know about our existence but that could be true just like you take nature around you for granted like birds

chirping in a tree or a cat crossing the road. You may take notice but are not overly obsessed with the animal where you stop what you are doing and see the dog, cat, bird, squirrel as an equal. Aliens could just casually say those are humans in this or that stage of development without being overly impressed as if it has been observed before. Other advanced life that has been observed elsewhere may be more interesting or smarter than we are. A good example is the class structure in our society. Rich people have nice cars, a nice house living in a gated community that you can't access and the working class go on about their life knowing that unless they win the lottery they will never have those type of material possessions or high society social status. The same applies to aliens, If aliens send a drone or scout craft far more advanced than our own technology yet keep a distance and are unwilling to share - so what? One day humans may reach that level of advancement since there is life around the universe with various levels of evolution. Some life may be in the early stages of space travel like humans, some life may be only terrestrial going through an industrial revolution, some life may be at the later stages of space travel and migrate from star system to star system using resources that are available in space like heavy water in the form of ice, as Gene Watson puts it,

“The advantage of an interstellar fleet. It’s their home. They are not looking for a planet to colonize. A fleet means the spaceships are specialized in a variety of support activities where dispersion is protection from being stricken with meteor showers. Any damaged ship sends an sos where help and repairs comes the surviving fleet. Hence a lot of activity within the fleet with exploratory drones sent ahead to give advanced notice for maneuver changes to avoid collision with dust clouds. Hence within the fleet there is a lot of smaller ships transporting people, food, spare parts to maintain the fleet produced to repair anything including their tritium nuclear fusion reactors.”

Some aliens may be similar to humans, sharing a similar evolution and could communicate with humans but we tend to take other animals around us for granted. I’m sure aliens are no exception knowing that there is an abundance of life and exoplanets similar to earth with civilizations in various stages of development, decline, or on the verge of self annihilation. Some speculate that aliens wouldn’t look like bi-pedal humans but the brain-to-body mass ratio may be very similar. There may also be evolutionary similarities like humans walking upright. It shouldn’t be surprising humanoids could have evolved independently from

humans on other planets and develop aircraft and spacecraft that have similar features to our own like a circular winged craft or flying saucer.

## 5. The Human Race is Not Important

All living creatures, even those we slaughter and consume like a chicken, view themselves as important and humans are no exception especially in the way we treat the environment as if it was there for us to exploit and consume to our own liking. Environmentalists see preserving the planet's ecosystem as important even though some calamity not of our own doing like a giant asteroid crashing into earth amongst other remote possibilities may render their own efforts inconsequential. Humankind still has a terrestrial mentality. Most people don't understand or contemplate the vastness of the universe with the millions of stars and galaxies much less are able to comprehend it. Stars in the sky when not blocked out by light pollution from a city even when visible are mostly ignored since people rarely look up at the sky unless there is a pretty sunset or a bright full moon. How many falling stars have you observed in your lifetime. It is a rare occurrence yet most have seen a falling star yet could not recount how many times.

There is one fact about the human race that will be hard for people to swallow: Nothing we do no matter how technologically advanced we become will have any noticeable impact on the universe. We will also not be able to explore the entire universe much less travel to neighboring star systems due to the sheer distance. Wealth and material possessions are only important to our own species like a squirrel collecting acorns is important to a squirrel and we take little notice - the Universe does not care what humans do. The military can create the biggest weapon but a supernova or a star exploding will still be more powerful. What human beings do is only important to other human beings and all living creatures evolve to a point before becoming extinct like the dinosaur or Neanderthal. The Universe with the millions of stars and galaxies continue to exist. Many stars including old red dwarfs will exist beyond the human species lifespan. Overtime any relics left by humans will turn to dust or particles as planets die, stars like our sun (Sol) die and new stars form, new planets emerge. Other intelligent life may happen elsewhere not knowing of our human existence. What you do is only important to other humans like what a wolf does is important to the wolf pack. Your mark in the world only has importance in the short term around other humans. Some people will be remembered by other humans and be put in

history books but even historical figures start to become less relevant overtime. Walk around an old cemetery and observe the tombstones by wealthy or accomplished people who could afford a nice plot and a tall tombstone. Only the birds or squirrels in the area that venture into the cemetery take notice seeing the tombstones as mere stones or objects. Most of these names, even if noted in history books or old news articles that are on microfilm at the Public Library or on old internet archives like the Wayback Machine have been long forgotten about by the public at large, going about their daily life activities only passing the cemetery without even a glance. People get so caught up in ambition, career, or accumulating wealth, building a name for themselves even to the point of neglecting loved ones that they realize that once they get older and don't have much time left in this world that is was all in vain. In reality nothing a human being does will have any importance to the universe. It only means something to other people or the environment around you during the current time you are living. Some animals are loyal to humans like a dog but survived without humans before the animals were domesticated. If the human race suddenly died off nature would reclaim cities and monuments. The sun would still rise and the stars would still twinkle in the nights sky. In the future it is a real possibility that the sun

and moon will rise with no humans on this planet but instead there will be another animal that has evolved and developed their own language, the early signs of civilization, religion or idol worship etc. just like humans. This was depicted in the movie Planet of the Apes.

6. Innovation is just an illusion. Things only change.

Look around you when you are out in nature. What you are seeing has been around before people walked on the face of the earth or came down from the trees. All a plant needs is sun light, water, and fertile soil. It produces fresh air for us to breath. It has the solar panel beat that ends up eventually going along with other electronic gadgets and devices to a landfill. Plants don't need a software update or for people to take care of them. When a plant dies like tree leafs it does not need to go to a landfill, it can be turned into mulch, or a dead tree can be turned into fire wood to cook or for when it gets cold. Sure some plants will die if there is drought or flooding but weeds, grass, trees, flowers will sprout and thrive in another area. Some species of plants or trees have been around for thousands of years without changing much. There is no need for "innovation."

Fossils of the dragon fly insect can be dated back to the time of the dinosaur. Fossils of sharks go back millions of years. Why change for the sake of change if a formula works? When you are standing out in the woods ask yourself what is more innovative The technology gadget you are holding loaded with software or the nature you see around you that's been here longer than us? Many people go along with technology innovation as to not be left behind because everyone else is doing it yet they seem unhappy, even increasingly alienated from others around them wired in to a cyber world scrolling through a screen that has become their social life and means of entertainment. Many live in suburban sprawl and make long commutes to work and when the work day ends get stuck in traffic on the return trip home, only to do it all over again the next day. The alternative is to become homeless, a societal issue that technology "innovation" has not solved. The few that have made lots of money because of technology innovation think they are God and somehow this makes their opinion matter more than others, always grabbing news headlines. But does their opinion really matter? Were they thrust into that position because of circumstances and are fallible like anyone else? Even with success enjoyed by a few society still has problems that philanthropy or celebrity status has not resolved. Putting people on a pedestal or idol

worshipping is not that innovate or new in human society. It's the same old human behavior. Only the names and faces have changed until becoming a statue or a tall tombstone that overtime nobody notices. A person's name may or legacy may live on in a building named after them or a foundation but even that fades overtime replaced by new names. Things did not innovate but evolved and changed. People are living longer because of modern medicine and increasingly reliant on prescription drugs that show up in the sewage and water treatment plants but are they necessarily happier for it? Is living longer because of modern medicine a more fulfilled life? My grandfather would complain he lived too long. All the people he knew were dead including his siblings as his eyesight started to go spending the last years of his life in an old folks home. Modern medicine making us live longer where we can barely get around or in my grandfathers case loose our eyesight is supposed to be innovative. Lets say a virtual world and artificial intelligence by putting on a headset device could make you appear young again to other virtual people. It wouldn't be the same would it? Your real body would be old. You couldn't meet the other people that you interact with in the virtual world in real life with your youth restored because you would still be old in the flesh. Here technology that is supposed to be innovative and liberating

can be cruel, making many live a lie because we only have one life experience to live and have to come to terms with aging or getting old. Having regrets and those missed opportunities of our youth is just a part of life. Things or people only changed whether we took the initiative or advantage of these changes for our own benefit or became complacent losing out and that's just the way life goes. Our lives, the life experience did not necessarily innovate. People have these expectations based on what society dictates but life rarely turns out the way we wanted to. How many people would be happier with less technology, a simple life the way nature intended and not becoming a cyborg or an electronic device attached to their body, or even enhanced by a microchip? Tending to farm animals, growing crops, not commuting far from home, having some land to have space and privacy away from your neighbor. Reading a book and feeling the pages with your hand under candle light instead of watching a million streaming TV shows and movies or becoming internet addicted to social media but instead stimulating your mind, learning to play a musical instrument, or making something you can use. There's a lot of talk of innovation or technology disruption yet the working class have not really benefited - only more poor because of it. They get the squeeze while CEO's benefit and have to work longer hours just to make

ends meet spending less time around family and loved ones. There's been more alarmist rhetoric by politicians, the enemy has become domestic threats, less privacy, shooting and random acts of senseless violence. So called technology innovation has made life more complex and people unhappy or acting ugly toward each other - almost having a dehumanizing effect. People can't be fallible or have a prejudice and become canceled where there is a lynch mob mentality and now talks of artificial intelligence replacing you at work but don't robots lack compassion or emotion? Isn't that who we are becoming because of so called techno gadgetry and 'innovation?' One could easily argue that so called technology innovation once seen as liberating for human progress has crossed a threshold and human beings are now seeing its dark side. Why do we need more and more advanced sinister weapons, artificial intelligence smarter than humans or replacing us, or a virtual reality, a virtual world separate from our own reality? Maybe there is no such thing as innovation. Many ideas are recycled and not that new. Things can change or become novel but not necessarily for the better. Becoming a robot devoid of emotion or compassion living on the planet mars and no longer needing to breathe air would be a change for the worse. You've turned yourself into a snack machine or a coke dispenser and the billionaire

technocrat has turned themselves into a freakish lizard person or brain kept alive in a jar in order to extend their life. Humans only prove that they repeat the same mistakes and don't learn from history. Today's news headlines are a prime example. Innovation is only an illusion and technology is actually more primitive than the Mother Nature around us. In nature things only evolve and adapt to changes - there is no innovation. Some things change more than others because things don't change for the sake of change. Many lifeforms adapt and only change when it is necessary because of factors around them.

## 7. Does What We Do Matter?

In the Universal scheme of things no but there are consequences in our actions on a societal level. As already stated humans will have negligible impact on the Universe with the millions of stars and galaxies that will never be explored by humans. Our actions and behavior is only important to other humans and affects our own planet - usually people around us. Humans could easily make the planet earth uninhabitable with nuclear war but extinction level events have happened before on this planet with no human involvement and I'm sure that could also be the case in the future no matter how

much a tree hugger or a diplomat you are. Now onto the subject of human behavior. Our politics, religions, modern society must mean something right? Much of our behavior can be explained by the nature because we are primates and still carry the traits from the animals we evolved from. Humans gather in tribes or identify with a culture or nationality. We like to follow a leader or alpha male and that is similar behavior exhibited by other apes in the wild or even a pack of wolves. Women tend to be attracted to the alpha male too and that is also instinctual. Of course human culture is a little more complex with modern civilization but we retained many of the attributes from tens of thousands of years of evolution being hunter gatherers, defending territory or fighting off other tribes. This is reflected in human war like tendencies and even in sports where fans at a sporting event either show adulation he winning or sometimes aggression after a loss. Stating that humans are primates is not diminishing human importance but simply stating what science supports. Humans are mammals and hominid land dwelling animals closely related to the great ape. There was Homo Erectus, the Neanderthal that was similar but not the same species, and now Homo Sapiens. Of course there are creationist and religious people who do not like Charles Darwin or the theory of evolution because it lessens human 'Godly' importance

but other animals have shown to sometimes have ritualistic behavior like mourning their dead. If you asked a religious leader will the Earth and universe with its billions of stars and galaxies still be around after humans are gone they may not have an answer. There is only end times prophesy or a 'rapture moment' where all humans are taken away that seems less plausible now that we know more about science and the universe. Before monotheism there was polytheism and tribal ritualistic behavior like burial mounds or shamanism. What If humans suddenly disappeared? Nature would reclaim cities and the laws of the land would be of the natural order. Domesticated animals like dogs would reform into packs like coyotes and wolves. There would be a rise in large predators like the lions and tigers in Africa or the roaming buffalo would return to North America. Animals that humans almost made extinct would rise in population and start to flourish again. This isn't to wish humans would vanish from the face of the planet but just to demonstrate our importance is only meaningful to our own species. What we do doesn't have an impact or matter that much, if at all, in the Universe scheme of things but what you do does have consequences living in a civilized society or for our own survival. Even if you are an atheist or don't believe in hell you have to abide by laws or become locked away if you try to create your own

rules or by committing crimes and killing others. Society would not function if people ignored laws and had no ethics or did not value human life. That said if you did something embarrassing, or you made the wrong choice that you have regrets about, or you made a life-altering mistake like an accident you shouldn't worry because in the scheme of things our own existence as a species is finite and eventually there will be no record not even fossils of human existence. Our beliefs, our history, our relics, our technology will all be gone, including this book you are now reading. This may help some who are at an end point. Humans will come and go and anything weighing on your mind will have been forgotten. It didn't matter that much anyway because life is utter nonsense in a way.

Religion = can be explained by tribal behavior, idol worshipping, following the alpha male. i.e. a God, messiah, priest.

Government = a government or nationality is explained by tribal behavior, your tribal affiliation, political leader

Art = is a social behavior that only appeals to other humans or a form of human expression.

Music = only appeals to human culture. It's a form of human expression, language and cultural identity.

All of the above have no importance to the

rest of the universe or wildlife on this planet. Let's take human built structures like roads and buildings. Animals and insects only adapt to how we alter the landscape but do not care about your nationality or flag, what language you speak, or how humans expresses themselves. A squirrel will climb a tree in your yard and climb on your roof without asking for permission or respecting that the property belongs to you. There is no round of applause or extra twinkling of the stars in recognition of human achievement or human stunts like doing a trick on your skateboard. There's no dimming of the stars in the sky after human loss or tragedy. Animals in the wild don't laugh when we fart. It is a natural bodily function. What humans do is only important or has meaning to other humans and has no consequence to the rest of the universe.

## 8. What is The Meaning of Life?

This is a question everyone wants to know. The answer is there is no meaning - you just exist like with any living creature. Humans are like any animal that has a life cycle, fight or flight response, the natural urge to procreate. Society often dictates our purpose like wolves part of a wolf pack with laws, rules, and mores as taught in Sociology.

There is a pecking order and a person discovers where they belong. Like the concept of infinity, life having no meaning in that we are not that different than other animals may be a notion hard to take for some people since humans have dominated the planet and have a high sense of self importance as dictated in religion. Older people tend to be more wise and cautious, and younger adults more reckless during the time of courtship or sexual selection. Life's meaning for a person changes over time from the family planning stage, to career ambitions, to becoming old and focused on retirement. Human children take longer to raise than other animals due to brain size. Feelings of fondness and intimacy or what we call 'love' exist as a natural process necessary to care for our offspring. This is true with other animals. If there was no attachment to nurture the young then it would decrease the odds of survival. Baby's look cute and adorable because they want to be fed. Those who have children when raising a family have a renewed sense of purpose and a growing sense of maturity. They tend to be less rebellious and boring or become more conservative, working long hours to meet society's ideals like having a respectable career, income, house, car etc. compared to teenagers who have lots of free time. Some people use religion to give life greater meaning and purpose even though many

religions have come and gone and there is no evidence of divine intervention or the supernatural, only stories. Life is really nonsense since nothing you do matters to the Universe. This does not mean you have to be cold hearted or just stop trying because it does matter to your own life and those around you. If charity or being kind to others makes you feel good then go ahead and do it. People want to give their life purpose and meaning and there's nothing wrong with that but we create our own meaning or give life order but lets not mistake the order we give life with how life really is - sometimes out of our control. There is chaos as proposed in the chaos theory. We create order in our lives living in a civil society but things are really random and sometimes out of our control. When tragedy strikes and a person suffers a loss they ask why God let it happen or why me when their sense of how the world works was flawed to begin with. Anything could happen at any given moment where it's hard to predict. Not always being in control since the Universe is chaotic and things happen at random may overwhelm some. Modern culture gives people a false sense of security as the case with natural disasters like it's a reminder by Mother Nature that were not in control of the Universe that is far greater than us and can't be tamed. Our own civilizations are far more fragile than many who take a modern lifestyle for granted

think. This isn't to imply you should run for the hills and build a bunker but if there is one thing that has been evident over the course of human history is the rise and fall of great powers or the rise and fall of civilization. Our own civilization is no exception. Some believe this will result in a doomsday scenario where life for humans will have no more meaning because of self-destruction living in the Atomic age with weapons of mass destruction. 'End of the world' prophesy has been predicted even in more primitive times where human life's meaning has an ending. This may be true to a degree since all living creatures eventually become extinct by one reason or another. It all comes full circle for humans who have a heightened sense of self-importance like those who believe in the Big Bang going out with a Big Bang in self-annihilation when shit hits the fan. Battle scarred soldiers will question the meaning of life where there is a high suicide rate. They believed in false ideals like 'us versus them' war heroics as depicted in action movies only to come back emotionally scarred suffering from PTSD questioning their own sanity. Some soldiers will not come back at all returning to an early grave. There have been many militaries from different cultures going back thousands of years that fought in wars that had meaning at the time but they no longer do. It's only mentioned in history books that most will not read. What was

meaningful and seemed like a noble cause fades away overtime until it's irrelevant and forgotten. If you notice politicians or weapons developers don't fight on the front lines - they get someone else to do it because they still want to live where there life has meaning. With all of our advancements and modern conveniences humans still justify crimes against humanity, torture, genocide, or war crimes where the savagery of war is awful to begin with. There is also the sensationalism of violence in movies and entertainment. Such a repeat in human history where atrocities are committed may point to an innate flaw in the human species, that even though Homo Sapiens have larger brains and dominate the planet, it does not necessarily guarantee longevity. There could be a period of prosperity as modern civilizations peak and then a period decline to self destruction. There is not always a guarantee that humanity will continue to progress with peace and prosperity. A small minority of people control much of the world's wealth. Life's meaning to them, who have a heightened sense of entitlement is different than a person coming from institutional poverty and are more prone to crime, a lack of proper education, and becoming incarcerated. I found the more decent people in society are not the 'puppet masters' or policy makers but tend to be the 'common folk' who only want to provide for

their family and have simple needs met. They tend to work hard and enjoy life without thinking too hard about life's meaning. As Voltaire once stated, to paraphrase, "tend to your own garden" living the simple life instead of chasing high ambitions. Other people are driven by accumulating wealth wanting to be viewed as 'winners' and having a status, yet this may not be enough to make a person happy since the ambitious person once attaining wealth is overly concerned about their high status. Animals in the wild tend to only consume what they can eat and thrive when conditions are right instead of being consumed by material possessions or killing for sport. Monks search for meaning by meditating serving a spiritual calling, not concerned with attaining material objects. The bottom line life's meaning varies for individuals depending on their beliefs, culture, and values, most of which have a more terrestrial micro-view of the world but there is no real meaning. Life is more meaningful based on our own perspective and people and events that happen close around us but is less meaningful further away. A human life would have no meaning in a distant galaxy where what happens in our solar system is irrelevant. You just exist as an animal relying on instinct, the need for survival like any other animal as evident in the fight or flight response and after humans are gone the universe will continue to exist

without us, where inevitably life will happen on some other planet. Humans are not very prominent in life's bigger picture or meaning which is the infinite universe that never ends and keeps going and going - we are just here for a moment like any living creature that comes and goes, becomes a fossil, and disappears when a planet ceases to exist.

## 9. The Religious Paradox & Unexplained

Being an atheist will get an angry reaction even if you have doubts about God or the veracity of age old religious claims. There's not a huge distinction between folklore, fairytales, legends and modern day religion except the seriousness of the subject matter. While one is a fable meant to entertain and teach a lesson through story telling the other is a story but should not be questioned like it really happened. God etched the 10 Commandments into stone kept in the Arc of the Covenant and a messiah walked the face of the earth according to Judeo-Christian beliefs. Religion does serve a purpose however as a type of moral compass. It should be no coincidence as church attendance is down so are society's morals but do people need to worship a deity in order to behave well? Even if you believed in nothing there needs to be rules and laws to have a civil society or there would be total anarchy and humans would devolve to savage

animals pillaging other small tribes like depicted in post-apocalyptic films or when there is widespread looting and civil unrest. Monotheism became the dominant religion but my theory is it had to do more with agriculture societies and the forming of early human civilizations away from smaller hunter-gather shamanistic societies. Religion's problem now is it's competing with too many choices for a person to entertain themselves instead of going to church in the high-tech society we live in. The material world and what it has to offer is more compelling than the church but some like technocrats have made the mistake of worshipping technology and "innovation" which is just an illusion. In an infinite universe nothing is really "new," just as I pointed out a blade of grass using photosynthesis is more advanced than a solar panel that will eventually find its way to a salvage yard. Technology may be beneficial but is not the end all and could be destructive to society if used irresponsibly. Respecting basic human rights is important because if everyone acted cold, wicked, and evil like with senseless violence then society would not function. People's main concern or one of the driving factors in going to church aside from a person's culture and wanting good morals is what happens after we die. Many want to be a good person in God's eyes and not go to hell - eternal damnation. How

do you prove the existence of God or an afterlife? There have been events in my life that I've had a hard time explaining. Working as a security guard on the graveyard shift there were co-workers who reported seeing ghost. I had my own dreams of deceased relatives and pets.

Here are some weird but true stories I posted to my blog. Is there something more to the Universe than the material world?

### A Deceased Cat Visits During A Dream

I had a cat in my family that lived for a long time and proved that cats really do have nine lives. She was adopted from the Humane Society during the mid 1980s by my big sister. The cat was named Puter but my Mom later gave it the name Sachse. My Dad would scare it under the table and laugh. Our family moved around a lot and the cat never ran away or was lost in moves. It even survived a fire when my little sister caught the kitchen on fire. My big sister would eventually go to college in the early 1990s and the cat became close to my Mom and lived up to the early 2000s. One day the cat disappeared for weeks and we all assumed it was dead and then a few weeks later it returned home with its paws looking worn down and burs in its fur like someone picked it up and dropped it off somewhere a distance away. It was thin

and thirsty. When I heard the news Sachse finally died I saw it trying to run toward me in a dream but stopped like there was a barrier preventing it to return and the cat stared at me looking sad slowly fading away. I felt depressed the entire day after waking up.

### My Deceased Grandmother Appeared In A Dream After She Died.

My grandmother passed away from falling and breaking her hip and then being moved to an old folks home where she eventually passed away. Sometime after her funeral I had a dream where my grandmother appeared, it was like she was there in the flesh and I was in my grandparents kitchen, she offered food that was cooked in the microwave. When I would visit my grandparents I was known by them to like eating and having a healthy appetite. Later I woke up and thought about the dream making the observation that she projected how she remembered me when she was alive that I liked to eat food.

### Childhood Legend of the Sheep Man

When I was a kid living in Northern Italy in a town called Ferno there was the legend of the sheep man who lived out in the woods. The sheep man was half man and half sheep.

One day while out in the woods with friends there was the sound of cuckoos (birds) and out in the distance a man with a rake and a long beard was yelling and running towards us. My friends stared laughing and running away claiming it was the sheep man, I was so scared I could barely move my legs as I followed their lead.

### Strange Armillary Sphere UFO Dream As A Kid

When I was a kid living in Sachse, Texas one night I had a dream that was out of this world. I was in school practicing the baritone and there was an announcement by the principal over the school public address speaker that everyone should go outside and bring their brass instruments. In the dream everyone except me was hypnotized and formed a line outside. I tried talking to people asking what was going on but they would ignore me. Outside students and teachers were forming a line. There was a large UFO that looked like an armillary sphere with rings crossing each other in different directions forming a globe. It would transport people who were standing in the line up to the craft. The armillary sphere would rotate in one direction picking up speed and then slow down and slowly rotate the other direction picking up speed and slowing down, the rings inside would rotate

different directions with people inside the rings standing up with their arms and legs stretched out. It's kind of hard to describe or put into words. I stood there watching in horror as people were hypnotized and being zapped up to the craft. The sight of the armillary sphere was frightening. I woke up feeling amazed about what I just saw in a dream. I went into my big sister's room and saw she had an album cover with human figures similar to what I saw in my dream with their arms in the air and legs stretched out. Then I started thinking the brass in my dream probably had to do with me playing the baritone and my dream could be explained by things I've already seen except the armillary sphere and its unusual rotation. People forming a line in a hypnotic state and being zapped up into the ship would have been before The Borg appeared on Star Trek: The Next Generation. Could my dream have been some type of otherworldly communication trying to show a map of origin, or a type of cryptic transmission information download to my brain since the UFO in the dream was in the form of a celestial sphere or astronomical rings? It's something I later thought about looking back but can only speculate, at the time the dream struck me as something unusual, I woke up feeling overwhelmed thinking whoa what was that? From the book: *Postmodern Childhood* by Stephen Watson (2023).

## Seeing A Hologram After A Nightmare as a Kid

One night I woke up from a bad dream covered with sweat and on the verge of a mental breakdown. I dreamed these floating heads were chasing me around my Dad's beat up 1970s car in front of the house. I sat up in my bed and stared at a mirror that was on the bedroom closet door. I started to see a small point of light appear from the mirror and it started to grow larger and larger as if it was coming toward me, it turned into a floating face that was transparent like an image from a projector. It appeared like one of the floating faces in the nightmare I woke up from. Unlike the dream where I saw the armillary sphere from some months earlier, what I was seeing now was from me being awake and I couldn't explain it as my imagination. I started to hear a voice in my mind that claimed the cut-up face I was seeing as a floating head was me from the future and this is what would happen to me unless I killed my parents. The suggestion to kill my parents from the floating face seemed so unconscionable that I became suspicious, to me it looked like it was not supernatural but some sort of technology or of artificial construct, I walked toward the floating face and said, "you're just a hologram" passing through it and continued to walk to the

restroom to go pee. The feeling of utter doom like I was having a panic attack didn't seem natural so I went to my Mom and Dad in the living room with tears streaming down my eyes and I told my Dad what I just saw, his back was turned in the sleep position and said to go back to bed I was just having a bad dream but I got the impression he was half asleep and wasn't really paying attention. The following morning I wondered how the hologram emanating from the closet mirror was created. I noticed the closet mirror was facing one of the windows in the bedroom that had no curtain. That day my Dad wanted to pick up beer cans and go looking for scrap metal. We stopped at a grocery store, my Dad wanted to grab a two liter bottle of Coca-Cola Classic, while in the car I told him again about the floating face that looked like a hologram from the closet mirror as a pinpoint of light. My Dad had an alarmed look on his face and didn't say a word looking upset. Instead of going to look for scrap metal he went straight home. My father claimed he saw an apparition that looked like a hologram during the late 1970s at Mountain Creek Lake near Grand Prairie, Texas, a suburb of Dallas, there was also a Naval Air Station nearby. From the book: *Postmodern Childhood* by Stephen Watson (2023).

Apparition at Mountain Creek Lake

My father who was orphaned in Italy and adopted by an American family would claim to have an apparition of the Virgin Mary and Jesus at Mountain Creek Lake in Grand Prairie, Texas during the mid 1970s. I self-published illustrated books on my Dad's UFO concepts. You can see them by clicking [here](#). This is my Dad's description: "The date was March 23, 1978. That's how I saw Jesus and Mary on the Shores of Mountain Creek Lake, The Jesus and Mary I saw on the shores of that lake looked like a moving hologram exactly like the projection of Princes Lela in Star Wars. Only they were so close I could have passed my hand through them and have felt nothing. I could see the whites of her eyes and into her eyeballs at arm length. I heard no audible voice. Gravity had no effect on them. There was a strong wind. My clothes flapped. Theirs was totally unaffected. They disappeared by turning invisible-not by ceasing to exist. As ghosts I could have passed my hand through it like a holographic projection. Fine but both had their own separate way of moving while I was also moving. Ever try tapping your head and rubbing your stomach while walking and talking all at the same time? How then if I was imagining things create in my mind the simultaneous motion of three distinct individuals simultaneously?"

1946 UFO Occupant Descending From Craft

## Near Milan, Italy and Cover Story

My father in Italy lives with an elderly woman named Silvana who claimed to have seen a flying saucer and occupant in a pressure suit like the type worn by high altitude pilots like the photo of Italian aviator Mario Pezzi in the year was 1946 or 1947 a little before or around the time of Roswell. The story goes she was orphaned and riding in a car with some Nuns in Northern Italy heading toward Milan. Traffic came to a halt when a flying saucer with an occupant wearing a space suit was observed levitating underneath the saucer toward the ground. The saucer had bright rotating lights. The following day she overheard the nuns reading the Milan newspaper where it stated what people saw was a balloon, like it was a cover story. The Roswell UFO crash was also famous for releasing a cover story. Later on in life after seeing astronauts wearing a spacesuit it reminded her of the occupant she saw in 1946 or 1947.

“Silvana was in a car driven by a Nun heading toward Milan. A lot of people stopped their cars and looked at the spectacle. It was near a busy street in the countryside.”

“What makes this story interesting is Silvana had no exposure to any kind of UFO.

Literature. She was brought up by Nuns after the SS arrested her mother for passing anti-Nazi propaganda.

An illustration of this sighting can be seen in a self-published book entitled *UFO Occupants: Illustrated Depictions (2020)* Paperback.

### My Little Sister's Stephenville, Texas UFO Sighting

Long before the 2008 Stephenville UFO flap my little sister who was living with my Mom and I in a rental house in Stephenville would witness a flying saucer while smoking a cigarette in the backyard. The year would have been the year 2000 or 1999. The sun was setting so there was still some light outside. She could clearly see a flying saucer slowly moving at a steady pace over the tree line and ran inside telling me what she just saw and kept repeating that she didn't believe that sort of thing existed. She described the flying saucer as having a dome top with rotating lights around the perimeter. Later she changed her story that it was an airplane flying low after being teased at work where she claimed another co-worker observed the same thing but during the time of the sighting she was clearly spooked and frightened, even looking pale like she truly saw something extraordinary that evening.

She would later get married and move with her now x-husband to a trailer near Dublin, Texas where they claimed to see UFOs like lights jumping around in the sky, jumping around erratically. Stephenville is an hour away from Fort Worth where the Lockheed Martin Corporation has a location in the Fort Worth suburb of White Settlement, Texas.

Ghost Smoking A Cigar At the Hispanic Society Museum in Washington, Heights, New York.

Around 2007-2008 (I forget the exact year) I had a side job working as a security guard during the overnight shift at the Hispanic Society Museum & Library in Upper Manhattan or the Washington Heights neighborhood of New York. While conducting a patrol during the early AM hours I passed by a room and could distinctively smell cigar smoke but could see no smoke in the room and no one was in the building. The museum had security cameras and I observed no one in the building that night. When the Hispanic Society staff came into work I told them about smelling cigar smoke and a person that worked there told me it was the ghost of the founder Archer Milton Huntington (1870-1955). That was the room he sat in and loved to smoke cigars.

Ghost at 225 Park Avenue South

I worked as a security guard at the Port Authority headquarters during the overnight in Manhattan and a female security guard co-worker told of seeing a ghost while on patrol. She could see a man standing behind a glass door looking at her but was only visible from the waste up like he had no legs and then just faded away or disappeared in plain sight. The witness found the encounter very spooky.

At 225 Park Ave South while working as a security guard during the overnight I also saw on the CCTV an orb or laser pointer looking light moving around on a floor. I speculated it could have been a moth reflecting light but it looked like a perfect ball of light. It lasted about two or three seconds. I also heard stories told by other security guards who saw ghost. One co-worker said she was patrolling and saw a thin man behind a glass door from the waste up staring at her and then disappeared. In 2008 I worked at the World Trade Center construction site when it was still a hole in the ground and a security guard told me people saw ghost like those who died in the 9-11 terrorist attacks. Some would see the ghost of a business man walking around the World Trade Center site holding a briefcase.

My Grandfather's UFO and Asteroid Encounter

My grandfather named Bill B Day from Comanche, Texas was never into science fiction but would sometimes tell stories about his life. When he was a young man in the Army Air Force he was laying in the grass with his father in New Mexico they were looking up into the nights sky and what they saw shocked them. Flying from horizon to horizon was a triangle formation of UFOs going at a high rate of speed. Then returned flying back the other direction in a straight line. His father said something like the heavens have many strange wonders.

Another time when he was young during the early morning hours while milking a cow in the Texas Panhandle a giant fireball light up the sky like daylight and he thought the world was coming to an end. It left a huge streak in the sky. He also tells the story of being alarmed while serving I the Army Air Force when hearing Orson Wells famous radio broadcast War of the Worlds and ran trying to warn people in the mess hall.

Explanations?

What could be made of these strange life experiences that defy our current reality? Is it proof that there is something more to this life than our current perception? I recall dreams that were influenced by what I saw

on TV or my rebellious adolescent views at the time versus having any real visions.

Here are examples:

Around the time of the Armillary Sphere UFO Dream I had a dream where all time stood still like it was the end times. I was going to fire a weapon at the Washington Monument but before I could shoot off a shoulder to fire missile I could see the bright contour of an angel of light that appeared in the sky freezing all time. In another dream I broke through a spaceship piloting a Japanese animation style robot. There was a meeting of rulers or a council in a giant conference room like the UN and I fired a weapon at them before escaping breaking through a large window pane in the spaceship that sucked everyone out into space. I was also living in Sachse, Texas at the time and I remember seeing a show on TV about the book of revelations. I also saw cartoons like Robotech or Transformers that had robots and spaceships. These shows of course influenced my dreams. I was also into counter-culture when it came to music so that would explain my "against the man" attitude. Many people fantasize about standing up against the man and the political corruption or a "world cabal" but in real life are too afraid to say anything, falling in line and being stuck at a dead end job.

## A Real Premonition or From Anxiety by Current Events?

During the 1990s before the 9-11 terrorist attacks I had a dream about the future where young people were protesting in New York like society was collapsing and African Americans were afflicted with a virus similar to rabies like some type of genetic engineered ethnic bio-weapon where it made black people crazy and violent with the look of madness in their eyes. My Dad, my little sister Teresa and I were chased by an African American who was sick with the virus wielding a machete through Central Park. I also saw a jumbo jet airliner with what looked like terrorist jumping out of the plane with parachutes displaying a terrorist flag. There was a slow build up of terrorist attacks before 9-11 like the first bombing of the World Trade Center and the USS Cole bombing. So instead of a premonition my dream could have been a reflection of what was reported in the news - the terrorism rhetoric build up after the fall of the Berlin Wall and end of the Cold War. I also had nightmares of the start of a nuclear war seeing a missile descend out of the sky and becoming paralyzed with fear. I grew up during the 1980s when there was the real threat of nuclear war. These dreams of an uncertain future could have been influenced

by TV and news events while going through adolescence. During adolescence having a nightmare could be a way to cope with stress and anxiety because of school, peer pressure, and bodily changes.

## Dreams Influenced by What We See and External Factors

It does not matter how compelling a dream is or how some dreams may reflect actual events in the future. Dreams don't really prove anything because it comes from your imagination and many things are sheer coincidence. You have to figure humans are not that complex and we tend to use the same words and not a wide vocabulary so that increases the odds of coincidence or sometimes feelings of déjà vu. Things we associate as a visitation by a deceased relative could be a type of morning by our own subconscious mind. All it takes is learning the news of someone passing and thinking about that person or pet animal to have a dream about them. Dreams that may seem weird and bizarre like about UFOs could be any number of factors. Was food with MSG eaten before going to sleep or maybe too much sugar or caffeine before bed? Or be caused by bodily changes and hormones like the strange dreams I had when going through puberty. People who hallucinate on drugs have out of body

experiences and see many strange things sometimes describing aliens. This is because your imagination is being used and hallucinating is similar to being in a dream state. Strange dreams can also be brought on by the release of stress, something weighing on your mind. Sometimes I dream I'm lost and can't backtrack to find my way back. That's because dreams only go forward and it's your imagination making things up as the dream unfolds. It's not uncommon to see a person you know in a dream and it turns into someone else. I had dreams where it was like I was in an alternate reality or it was a glimpse into an alternate reality. These dreams were very vivid as if I was really there. I woke up thinking how did my mind depict people in a chaotic bustling city in such detail? It was as if I was using the holodeck from Star Trek. The answer is our minds can be very powerful but what is depicted in a dream still references are likes and dislikes or what we have observed in real life. For example, a person in the 1800s would dream about things they have observed from that time period like fetching water from a well or if living in an urban area maybe a smokestack and now obsolete machinery from the industrial revolution - things the average person would not dream about today. A person today may dream about staring at their smart phone or something that references our modern day

culture. A person in a lesser developed world would dream about something that you see in the lesser developed world.

## Ghost and Apparitions Are Not Necessarily Supernatural

My father who had an apparition in 1978 attributed it to chemicals he was exposed to at a job. What are the odds it was the real Jesus and Mary like depicted in the Bible? The cigar smoke odor I detected in the museum could have been a trick or someone else was inside the building - old buildings sometimes have secret doors or ways to get in. The museum was also next to an old graveyard. It's easy to get caught up in the spooky atmosphere of a place and believe you are seeing things. Some museums may want to give the impression it's haunted to attract tourist since museums can be very boring. One way to give the impression of a ghost smoking a cigar is to have something that gives off odor like a scent diffuser. Another trick is to put a scent diffuser pad where the heater or vent is in the alleged haunted room. When the heat or air turns on at a certain time of night it spreads the aroma around the room like tobacco smoke. Then the rumor gets around that the ghost of Archer Milton Huntington, the founder of the Latin museum, smokes a cigar in middle of the night not willing to cross over to the

other side because of his museum collection and that the museum is haunted in turn drawing in tourist - in a city like New York where there is a strong tourism industry. Ghost stories from people like co-workers may seem compelling but you are left with just a story. Those from an academic background who study critical thinking will tell you stories are not a strong form of evidence because you are left with just a story. Trickery and jumping to conclusions, misidentified objects are also common. Creaking doors, shadows, critters that crawl around a house knocking over objects, a tree limb blowing in the wind knocking against a building all give the impression of a ghost especially when a person has heightened senses. In the day time there seems to be less ghostly activity as a person is less prone to become easily frightened. Why are humans easily frightened at night? When humans were hunter gatherer nomads they would have to fend off carnivorous predators that hunt during the night time, That's why there is the domesticated dog - to alert people of intruders.

## Human Trickery and Deception

As pointed out earlier things that may seem supernatural are actually clever trickery - a magician is a good example. Things we sense as unusual may not be that unusual at all. A

missing dog that wandered off and was eaten by a coyote or dumped somewhere by a family member because they didn't want to buy dog food; the legend of the Sheep Man in the Northern Italian woods who turns out to be a crazy hermit with a long white beard; a UFO that was an experimental craft; stories about aliens that reflect science fiction that was popular at the time. Then there are strange things that happen that may be truly bizarre but not necessarily supernatural in origin. The hologram I saw emanating out of a mirror in the bedroom after a bad dream may have been a real hologram or some type of technology since my Dad who was into man made flying saucers and experimented with ion wind may have alarmed some people in government. I could tell it was artificial in nature. Later in college I learned about age old illusion trickery using mirrors and reflection called 'peppers ghost' that was used in the theatre. Likewise the apparition my Dad saw at Mountain Creek Lake in Grand Prairie, Texas during the late 1970s was near a Naval base. The military did classified work with laser holograms in a field called holography. He claims to have tried to show some of his flying saucer or ion thrust concepts driving to Washington D.C. before seeing the apparition. One could understand how someone in Washington may have become alarmed if what Dad tried to demonstrate was something classified in

nature. You can read about his ideas in the book *Gene Watson - Flying Saucers (2014)*. America is known for its secrecy and even 'mind control' experimentation like MK Ultra.

Sometimes things that seem extraordinary or far-fetched turn out to be true but have a human explanation. As pointed out there is the trickery of a magician and then there are people who have it in for you and are messing with your head. The latter can happen let's say if the government is alarmed about something and someone wants to discredit you and make you appear crazy like a counterintelligence operation. Many have heard of Harvey Weinstein and Black Cube or the FBI's Cointelpro during the ear of McCarthyism. Institutions like the government seem to house all sorts of predators and this is especially true in an era of warrantless wireless surveillance where there is a lack of public oversight. Like in the days of McCarthyism there is talk of a 'political FBI' and a 'weaponized DoJ' with increased 'domestic terrorism' rhetoric and a secretive 'watch-listing' system using 'Fusion Centers' that lacks due process. I became a target of covert weapons technology from my internet activity researching UFOs in what is termed electronic harassment and later the Havana Syndrome. This was before the Pentagon's now public interest in the subject matter using the term 'UAP.' The details are

in my books *Covert Microwave Harassment Not Just 5G (2020)* and *Directed Energy Attacks in Los Angeles: A Memoir Of Electronic Harassment by the Authorities (2023)*. Could the government or dark world contractors be using EMF weapons like directed energy against citizens in an era of irregular warfare or it's tit for tat behavior in the espionage world explaining the Havana Syndrome? It certainly can not be ruled out since old news articles reference the development of such 'silent weaponry' that can't be seen but felt. You certainly can't trust your government to be honest who now wants to call the Havana Syndrome 'anomalous health symptoms.' The US Government also uses euphemisms to downplay its role in other nefarious behavior like torture. In 2020 there was a Directed Energy Systems Summit in Washington D.C. where the Department of Defense Non-Lethal Weapons Program discussed non-lethal directed energy used as "Intermediate Force Capabilities" where the battlefield lines are not clearly drawn. It seems to be the world we now live in judging by the news headlines. What was once science fiction like an oppressive "ray gun" or humanoid robots with artificial intelligence like in George Lucas' Star Wars is a real possibility. All targeted individuals or people who report electronic harassment can't be ruled out as crazy. There is human trickery, deception,

and 'gas lighting' covert activity that may explain things that are deemed unusual.

## Beliefs Change With the Times

What has changed over time is the perception of our world and reality, from the flat earth to the geocentric model to a vast uncharted universe observed by the Hubble Space Telescope. Some things have stayed the same because of human nature like those who question orthodox thinking being ridiculed or in some cases persecuted. People's belief in the supernatural continue to persist even with a greater knowledge science and scientific advances. During the modern era of the 20th Century technology was regarded as liberating and in the 21st Century it's becoming more and more evident there us an oppressive or dark side for advancing for the sake of advancement. With that in mind I sometimes think of the flaws and the paradox popular supernatural beliefs have. For example ghost: A haunted building will not be there forever or even Civil War era soldiers sometimes seen marching in the woods on a full moon. Are they still going to be there in outer space when the earth or our own sun no longer ceases to exist? Maybe there is a statue of limitation on how long a ghost haunts a building on this planet before crossing over into the tunnel of light to the other side. Then

there's the afterlife where a deceased person is greeted by their relatives. You've always seen your parents as elders and they've seen their parents as elders going back until you feel a close connection to the entire human population that has ever existed. Will you see your elders who greet you in heaven as older than you or will everyone be young like Jesus who died at 33 years of age? Some people's relatives died before becoming very old. I had a brother named Milton before I was born who died as a toddler. Your grandparents did not behave how they did when they were younger in their sexual prime since most people change over time. Maybe it will be like an illusion. You'll see your elders as older and you won't see their relationship with their parents and their parents parents parents or your great great grandparents. Some people believe in reincarnation - isn't that going to be a shock or maybe a deceased politician won't know that they are a maggot crawling around in dog shit. Will your flag have any meaning in the afterlife especially those who died for their country? It has no meaning for a corpse even if the person was a traitor or conscientious objector. They are dead and have no feeling. Nobody remembers warriors from the past who died for their tribe or a warring empire. Nobody gets chocked up about the Spartans from the ancient past who died in a fierce battle, nobody is falling

to their knees and crying over a fallen Aztec Indian or Roman soldier. History often repeated and time heals all wounds or makes people forget. The shock and despair my grandfather had hearing the Hindenburg disaster on the radio yet it is not mentioned by anyone today unless its a history paper or documentary. We our conditioned to believe what's important because of what the tribe we live in dictates but it's forgotten over time, things change and evolved and has little importance to the universe as a whole that will continue to exist when all is said and done where all history of the human race will be forever erased.

## 10. Life Has No Real Meaning. So Now What?

In this book I dispel that humans are important or maybe I put doubts into religious claims or the supernatural. Some may accuse me of misanthropy or Nihilism like some other writers from the past who expressed satire or cynicism of our own species. Some may say that I'm a person that needs to get laid and thinks too hard about stuff and that may be true in some respects. I remember working at my Grandfathers small town radio station and there was a disc jockey who was becoming middle aged and unhappy.

He left the missionary doubting his own faith and seemed to think life was pointless, it had no meaning. I asked him if he was happier at the missionary? He said yes. Then I asked him why don't you return to just doing that? He later thanked me and went back to doing missionary work since that is what made him happy. Those who read this book should have an agnostic look or just have faith and believe in what feels right to you and makes you happy. The alternative - atheism is a very cold and empty place. On the other hand maybe life having no real meaning and the notion that humans are not that important since the universe is infinite could be liberating to others like a weight off your shoulders. You were conditioned to follow, not question authority, pressured to achieve, live up to others expectations, too afraid to take chances, or you're a famous person that has become reclusive but now you know the real meaning to life - it goes on forever and we are only here for a short time. In the scheme of things who you are and what you do doesn't matter. Maybe you should lighten up again and lift the burden of life's pressure or regrets from the past that still haunt you. Start to enjoy life again on your terms knowing it's not that serious. You may be in dire straits or lost everything but as the saying goes it's only money. You can always make more money or get by with less. I once watched on TV an interview with Orson Wells

who said material possessions can possess us after he lost everything in a house fire. Who hasn't gotten carried away with a collection or became too possessive? Archer Milton Huntington (1870-1955) should know. His ghost still lurks around the Hispanic Society of America Museum adjacent to an old cemetery. All human history and even history of this planet, our sense of time will completely be erased. The stars, the galaxies will still be here. Live the life you want to live without worrying too much about life's real meaning because there is no real meaning. Life's meaning is the meaning we give as animals, living and being around our own species and we are only here for a finite time with no real affect on the Universe.

### Overview.

- Life is chaos and nonsense. It just exist and has no real meaning.
- Humans are important to other humans like a group of apes part of a tribe but have no importance to the Universe or scheme of things.
- All living creatures eventually become extinct and humans are no exception.
- Life has existed and always will exist at various stages of development because the

universe in infinite so aliens that may visit the earth in UFO sightings are no big deal.

- A person doesn't have to believe in God to act good. Following laws are necessary for a civil society.

- Innovation is an illusion. There are no new ideas. No one is unique. Things only change and evolve over time.

- Time is a construct created by us to measure and give structure to daily life.

- Since the Universe is infinite time has no meaning long term since no record can be kept. Stars, galaxies, planets form and die with the cycle repeating.

- There is no deeper meaning to life you just exist like any physical object, plant, animal, or insect.

## ABOUT THE AUTHOR

Stephen Watson majored in Liberal Arts. He has self-published books on Human Primate Press. His hobbies include open-source research and making electronic music. He was raised in the Dallas-Fort Worth metroplex, lived in New York City, and currently resides in Los Angeles, California.

Other books by Stephen Watson: *UFO Occupants: Illustrated Depictions* (2020); *Covert Microwave Harassment Not Just 5G* (2020); *Directed Energy Attacks in Los Angeles: A Memoir Of Electronic Harassment by the Authorities* (2023); *Postmodern Childhood by Stephen Watson* (2023); *Gene Watson - Irregular Desire* (2023).

Check out my fathers theories on UFO's and space travel: *Gene Watson - Flying Saucers* (2014); *Gene Watson Best of Propulsion* (2019); *Weirding Field Wonders* (2015); *Super Conductor: UFOs How They Work* (2019); *Gene Watson - Bevatron* (2023).
